Optimizing the Processor Platform

Android Support Quad Core

The Good News: Heavy Lifting Already Done

The work required to go from 1 to 2 cores was much greater than to go from 2 to 4 (or more) cores... Android 3.0 (Honeycomb) natively supported Quad core out of the box in June 2011

If you have 4 threads and 4 cores, Android will schedule a thread per core

Good tablet application performance requires a balanced processor architecture (CPU speed, Memory BW, HW Accelerators)

Application

- HW Dependency #1
- HW Dependency #2
- HW Dependency #3
- User satisfaction 'metric'

Browsing

- CPU speed (rendering)
- Video HW unit
- Memory bandwidth
- Fast page draw

Imaging

- JPEG HW dec
- Memory bandwidth
- 2D perf (swipe)
- Fast image viewing

User Interface

- CPU speed (geometry)
- - 3D HW unit
- Memory BW
- **Responsiveness**

Video Playback/Streaming

- HW video unit
- Memory bandwidth
- jitter-free video

Games

- CPU speed (geometry)
- 3D HW unit (TPS)
- Memory Bandwidth (complexity)
- **Richer graphics, no 'lag'**

Email/IM

- CPU speed
- Memory Bandwidth
- **Responsiveness**

User Interfaces – Characteristics and Implications

- **UI content is inherently dynamic**
 - Unlike Games (which use pre-cached images/textures)
 - User content can/will change at any time
 - Therefore UI must refresh continuously in case new content emerges
 - Requires high speed (533Mhz) and wide (64-bit) memory bus to ensure high frame rates

Recommend Dual Core + 64-bit Memory Bus

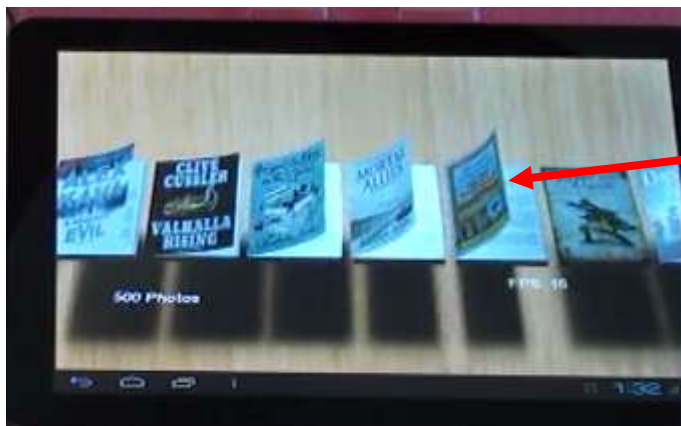

User Content is dynamic and (potentially) always changing. Especially true of streaming movies, YouTube, pictures, home movies

- **User expects their 'latest' content to be instantly visible when scrolling (either touch or via remote with TV)**
- **Thumbnails must be visible and smooth as they scroll left to right.**

User Interfaces – Characteristics and Implications

- **UI requires high resolution support → 1080p TV or LCD is now the norm**
 - 1080p30 fps content is becoming a standard offering from websites and streaming
 - 1080p60 is around the corner
 - Must be able to decode h.264 High Profile 1080p at high bitrates (for user content decode as well as for video streaming over the net)
 - Must be able to support newer 1080p TVs. Consumer devices starting to hit >1080p LCDs (iPAD HD) Requires large memory space, fast display capabilities, in hardware rotation/scaling
 - Advantage Freescale i.MX 6: up to 4XGA, dual display engines, 64bit memory space @ 533Mhz
 - **Access to fast CPU MIPS → used for complicated transforms to augment visual experience**
 - CPU cores useful to add in additional transforms that don't map well to 3D unit
 - Morphing effects and some fluid dynamics for innovative UI effects
 - CPU cores can also be used to augment 3D unit and act as a 'secondary' 3D unit
 - Advantage Freescale i.MX 6: up to Quad core Cortex A9 at 1.2Ghz → nearly 5Ghz of CPU horsepower
- 
- A gold-colored shield-shaped logo with a black border. The top half of the shield has a black background with the words "Full HD" in a gold, serif font. The bottom half of the shield has a gold background with the text "1080p" in a bold, black, sans-serif font.

Gaming Performance

- **Benchmarking 3D game performance is tricky**
 - Dependent upon the 3D HW, the CPU speed and memory BW
 - Must balance all three to get best performance
- **Review websites use generally available benchmarks to rate tablets**
 - Example: Basemark, NenaMark, Antutu, Quadrant

Taiji Girl (Basemark ES2)

Tile Based Rendering (Chunkers)

- Size of scene buffer unknown before rendering
 - Possible overflow if scene requires more data than expected
- Good rendering method for baseline GUI/3D Apps with smaller object count (less details)
 - More bandwidth efficient than FMR in simple (yesterday) use cases
- For next generation dynamic scenes in new and future applications with lots of objects, details and post-processing effects, tile based Chunkers require multi-pass memory access to constantly process changing 3D/scene data
 - PC Level Applications (Performance, Quality, Effects) → Tablets → Smartphones → Infotainment

Packaging and Qual levels – 21x21 FCBGA Package

- **Lidded – Auto and Industrial**
 - Contains a metal lid covering the processor
 - More robust for industrial or automotive environments
 - **Non-Lidded – Consumer**
 - Exposes the back side of the die (flipchip)
 - Lower Z-height for space constrained devices
 - Easier to attach custom heat spreaders
 - **Three types of Qual for i.MX 6Series**
 - Consumer→ Highest Frequency
 - Automotive→ Maximum environmental support
 - Industrial→ Longest duration (“always on”)
 - **Only Non-Lidded packaging will be available in Consumer Temp**
- 
- The image contains two visual elements on the right side. The top one is a cross-sectional diagram of a lidded package, showing a metal lid on top of a die, with solder balls connecting the die to a substrate. The bottom one is a photograph of a non-lidded package, showing a square die with a grid of solder balls on its underside, mounted on a substrate.

* 6Dual cores are estimated on 6Quad by clock gating two cores

- All results include power at the chip (cores, accelerators, peripherals, DDR I/O) as well as the power consumption of the external DDR3 ICs.
- Power application notes listed in the presentation contain the full breakouts for the chip and DDR3. Note that use of LPDDR2 memory will substantially reduce memory IC power consumption
